Module 09 - Fixed Charge Problem

Exploratory Data Analysis

In this section, you should perform some data analysis on the data provided to you. Please format your findings in a visually pleasing way and please be sure to include these cuts:

- Make a visual graph of your data on a map (coordinates should be within US borders)
 - o https://mvmaps.google.com/
 - o Find a map with latitude/longitude and place them approximately
 - Any alternative that gives the same effect

Model Formulation

Write the formulation of the model into here prior to implementing it in your Excel model. Be explicit with the definition of the decision variables, objective function, and constraints.

MIN: $X_1 + X_2 + X_3 + X_4 + 2040Y_1 + 1216Y_2 + 1615Y_3 + 2331_4$

 $X_{11} + X_{21} + X_{31} + X_{41} \le 869$

 $X_{12}+X_{22}+X_{32}+X_{42} \le 800$

 $X_{13}+X_{23}+X_{33}+X_{43} \le 519$

 $X_{14}+X_{24}+X_{34}+X_{44} \le 716$

 $X_{15}+X_{25}+X_{35}+X_{45} \le = 550$

 $X_{16}+X_{26}+X_{36}+X_{46} \le = 615$

 $X_1-4069_1 \le = 0$

 $X_2-4069_2 \le = 0$

 $X_3-4069_3 \le = 0$

 $X_4-4069_4 \le = 0$

All Y_1 must be binary $X_1 \ge 0$, i = 1, 2, 3, 4

Model Optimized for Min Costs to Supply DCs

Implement your formulation into Excel and be sure to make it neat. This section should include:

- A screenshot of your optimized final model (formatted nicely, of course)

- A text explanation of what your model is recommending

<u>The model is recommending to open Warehouse 1 and Warehouse 3</u> as the optimal pair to meet all distribution center demands at the lowest total cost of \$69,229. Model with Stipulation

Please perform 2 out of the 3 scenarios below with a short text description on what changed:

1. *Instead of only being able to open 2 warehouses, what happens to our objective function when we only can open 1 warehouse?* When only 1 warehouse can be opened instead of 2, the objective function increases by \$5,563. This increase occurs because a single warehouse must now serve all demand, leading to higher transportation costs, and possibly less efficient routing compared to distributing the load between two strategically located warehouses.

Warehouse	Distribution C	WH Lat	WH Long	DC Lat	DC Long	Mahattan

2. Right now, we have \$1 per unit shipped over the distance between the warehouse and the DC. What happens to our objective function when we increase this to \$30? Does your DC assignment change at all? Increasing the cost per unit-mile from \$1 to \$30 causes the total cost to increase significantly to \$1,970,881. However, the model's optimal warehouse selections and DC assignments do not change, indicating that the Warehouses chosen are still the most cost-efficient combination under both cost structures.

3. For distance between each location, we used Manhattan distance but what happens to our model if we use Euclidean distance instead? Did the change impact the model at all? Do you feel this is a better distance metric to use in this scenario?
